Waste options:

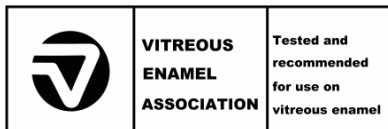

When specifying with overflow hole, we recommend a banjo-unit or floor fitted waste. If specifying without an overflow hole, we recommend a plunger unit. Please check our waste fittings for compatibility with each bath.

Our enamelling:

Drummonds' traditional dry-frit enamelling process involves heating the bath until red hot. Skilled operators then sprinkle the bath with dry frit (powdered glass), which liquefies on contact and fuses over the whole interior surface. The process is repeated up to five times to build up the finished layers of enamel. A gentle wavy finish distinguishes a Drummonds' bath and is proof of this enamelling method. The quality is emphasised by our 25 year guarantee against physical deterioration in the interior enamel finish, providing that you follow the care instructions below.

Caring for interior enamel:

You should only use mild detergent cleaners, applied with a soft cloth and plenty of water to wash away any gritty deposits. The bath should be dried with a soft towel after cleaning and general use. Under no circumstances should any abrasive, acid or bleach be used, or any cleaner containing acid, bleach or abrasives as these will, over time, affect the surface and reduce the shine. Always ensure that leaking taps are repaired and lime scale is not allowed to build up on the bath. For more information, please refer to the Vitreous Enamel Association (www.vea.org.uk) which lists suitable cleaning products for vitreous enamel baths.

The exterior of your bath:

A Drummonds' cast iron bath is finished to the same high standard as the interior of the bath and providing that you follow the care instructions below should last you a lifetime. Drummonds guarantee the exterior for one year against manufacturing defects.

Caring for the exterior finish: Raw, primed or painted exterior – other than occasional cleaning of the exterior of your bath to maintain the appearance, any chips or scratches in the paintwork must be touched in immediately to prevent rusting of your bath. Polished & lacquered exterior– care must be taken when moving your bath as any scratches to the exterior lacquer will require the lacquer to be stripped off and reapplied. Clean occasionally with a soft dry cloth and wax polish. Never use an abrasive cleaner to clean the bath. Take care when cleaning the floor around the bath, to ensure the floor cleaning product does not damage the lacquer on the bath.

All Drummonds' baths are manufactured by hand and as a result all quoted measurements can vary by $\pm 0.5\%$.

Pipework for Clyde bath with mixer	DAD3068C	Chrome	310 C/C	—	22	425.00

Tap Stands:

We recommend an access panel under the floor or in the wall to isolate the bathroom taps or mixer as the stand does not provide for this. Our bath mixers can not be purchased without either an H-stand (to be mounted on the floor) or straight or cranked legs (to be mounted on the deck).

Pipework:

We recommend 3/4" (22mm) pipework feeds for our bath taps. Taps are suitable for pumped or un-pumped water systems up to 3 bar. Where water pressure is more than 3 bar we recommend a pressure reducing valve is fitted in the pipework that feeds your bath tap or mixer. Pressure reducing valves are available from most plumbers merchants. Maximum water temperature 80 C, advisable 60C/65C

Care of our Brassware:

All Drummonds' brassware products are supplied with a one year guarantee against manufacturing defects and physical deterioration in the exterior plated finish. Never use an abrasive cleaning material on brassware or let limescale build up on brassware. Chrome or Nickel will maintain a shiny finish with periodic cleaning with Brasso however Brass will need more frequent cleaning to maintain a shiny finish. Use a proprietary non-abrasive bathroom cleaner for day to day cleaning of brassware.

Please note: Our mixer units do not come with legs, please see tap stands for more information.

C/C Centre of cold tap feed to centre of hot tap feed.

Wall/C Measurement from wall to centre of spout.

1 These stands are made to be positioned centrally to the bath, and will not work at the end of an Usk or Torridge bath.

2 The H Stand tripod is designed for use with our classic bath mixers.

3 The H Stand is designed for use with our classic long spout bath taps.

Bath Wastes:

Our plunger units are measured from the floor (or base of the unit) to the top of the collar. The plunger top, (that is lifted to empty the bath) can be adjusted in height.

- 1 This unit will fit all our baths. It is designed to connect the overflow and the waste under the floor. We provide all the pipework above floor, and your plumber will source appropriate pipework including a bath trap to connect under floor. We recommend an access panel in the bathroom for maintenance.
- 2 The banjo-waste unit is only suitable for baths with feet. It is designed to connect the overflow to the waste over the floor where the plumber will then run the waste pipe into the floor or wall as required. If a shallow seal trap is required we recommend our fittings set for this.
- 3 This fittings set will allow a trap to connect under the bath and the pipework to be run out into the wall as required with 1m of 42mm pipe.
- 4 This unit will only fit the bath specified. It comes with a floor mounted trap and with gridded waste to be fitted flush to the bath so no overflow is seen in the bath. Note this can be positioned anywhere next to bath except directly in line with feet. The shoe is angled to then run the water out into the wall or floor as required. We suggest the fittings kit if this pipe will be visible.
- 5 This plunger has a trap fitted under the floor which is approx 150mm below the finished floor and has the same features as the other plungers.

Care of our showers:

Please see the care of our brassware section on Page 4.

To de-scale your shower head, we recommend you detach the shower head and use white vinegar, and soak the head for a short time (depending on build up of limescale). If this does not work, then there are several kettle de-scaling packs on the market that may work. You will need to check the suitability of each brand and soak for a short period of time to test.

Our showers are suitable for pumped or non-pumped systems up to 3 bar and for best performance we recommend 22mm (3/4") inlet feeds. When water pressure is more than 3 bar we recommend a pressure reducing valve is fitted in the pipework that supplies the shower mixer (available from most plumbers merchants).

Operating pressures (on hot and cold line) should be kept balanced in order to ensure the maximum efficiency of the thermostatic mixer. Flow limiters are necessary when pressure differential is more than 5 to 1.

Maximum water temperature 80 C, advisable 60C/65C

Our Suites:

The suites include: Basin, basin stand (brackets with the Cam & Syre), waste, plug & chain, bottle trap. The stands have pins in the feet to set into the floor for extra stability & heights are measured to the top of the basin or marble. Our marble vanity suites are all made with Arabescato marble, a distinctive white marble with natural vein patterns which will vary with each suite.

Pipework:

We recommend 15mm pipework feeds for our basin taps. Taps are suitable for pumped or un-pumped water systems up to 3 bar.

When pressure is higher than 3 bar we recommend a pressure reducer is fitted (not supplied).

Maximum water temperature 80 C, advisable 60/65

Care of our basins:

Our chinaware is handmade, using the finest quality English china clay, and glazed off white. All china sanitaryware comes with a one year guarantee, against manufacturing defects and physical deterioration in the glazed finish, (as standard). When cleaning, please use a non abrasive bathroom cleaner. Our marble comes polished and is best cleaned with a damp cloth. If acidic or other products (including certain shampoos) are left to mark the marble it will stain easily so care will need to be taken. Marble is a natural product and vein patterns and colours will vary. Drummonds select marble for interesting vein patterns, but cannot guarantee they will be the same as our showroom/ photographed pieces. Our basin surrounds are carved by hand which gives a beautiful hand finished appearance and during the carving process we may strengthen or fill the marble as required.

Tap & Mixer Suggestions:

1 Suitable for single basin taps.

2 Suitable for basin mixer taps.

3 Suitable for single basin taps with extended spout or basin mixer taps with extended spout.

4 The classic basin mixer taps will not work with this unit, so we suggest the extended barra taps.
